

Hello World gRPC Service

Client is “*Console App (.NET Core)*” type project whereas server is “*gRPC Service*” type project.

This is a very simple service that is used as an example to show that how both type of C# projects communicate.

The example is copied from Microsoft official page for this type of service.

C# based client and server both are communicating.

Client sends a string to the server. Server concatenates that with “Hello” and sends back to the client. Client then displays the whole sentence on its console.
